### Abstract

Go to: 

The COVID-19 pandemic has required a rapid evolution of services to maintain routine care in Ireland. Services which had been previously slow to adapt technology in their practices are suddenly integrating various telehealth measures to continue routine practice where possible. In this article, we discuss the challenges we face in rapidly implementing telehealth in a rural Psychiatry of Old Age service in the North-West of Ireland.

**Key Words:** COVID-19, older persons, psychiatry, technology

With the advent of the COVID-19 (Coronavirus Disease 2019) pandemic and subsequent lockdown in Ireland on March 27, services have had to evolve to maintain ordinary care in extraordinary times. In a Psychiatry of Old Age (POA) service in the North-West of Ireland with poor broadband and lack of IT

**Abstract** The Coronavirus Disease 2019 (COVID-19) has accounted for more than 25 000 cases in Ireland with approximately 28% of the clusters in nursing homes as of June 2020. The older population is the most vulnerable to serious complications from this illness and over 30% of deaths due to COVID-19 to date have been in patients over the age of 65. Continuing to provide routine care within nursing homes in these challenging times is an essential part of ensuring that presentations to hospitals for non-essential reasons are minimized. In this article, we describe a project being undertaken by a rural Psychiatry of Old Age Service in the northwest of Ireland. We aim to provide ordinary care in extraordinary times by using mobile tablets within the nursing homes and long-stay facilities in our region for remote video consultations during the COVID-19 crisis.
